

High Capacity Trolley

This trolley is one of the methods of reducing or removing the weight from the shoulder of our members. The CWU has had a specialist small team – The Walk Design Group – working on your behalf for a number of years to try and influence the employer to seek ways of reducing the load that our delivery members carry. A basic but never the less successful fruit of these efforts was the HCT. It can carry 70kg of mail on flat or undulating terrain. This is currently in the process of being revised but the existing model is sturdy and a firm favourite with those who use it.

This trolley is designed to be deployed on routes immediately adjacent to the delivery office but exceptionally can be deployed further a field using either a large tail lift vehicle or more likely a HCT Ramp.
